

Programare in limbaj de asamblare

Instructioni MMX

Tehnologia MMX

- MMX – Multi-Media eXtension
- Obiectiv:
 - cresterea vitezei de prelucrare a informatiilor audio, video, grafica, etc.
 - Achizitia, prelucrarea si generarea **in timp-real** a informatiilor multimedia
 - Dezvoltarea de aplicatii multimedia la care timpul de executie (reactie) este critic
- Componente MMX:
 - Registre MMX (8), MM0 .. MM7; 64biti/registru
 - Instructiuni MMX (57)
 - Tipuri de date impachetate
 - Unitate de executie MMX

Tehnologia MMX – caracteristici generale

- Ideea de baza:
 - Executia in paralel a unei instructiuni pe un set de date
 - Paralelism de tip SIMD – Single Instruction Multiple Data (simulare)
- Tehnologia MMX este eficienta daca:
 - Datele au o structura de tip vector, matrice, sau o alta structura cu grad ridicat de regularitate
 - Aceeasi secventa de operatii se aplica in mod identic pe fiecare element al structurii
 - Aceeasi secventa de prelucrare se executa de un numar foarte mare de ori (ex: pe un milion de pixeli ai unei imagini)
 - Timpul de executie este critic

Tipuri de date MMX

Octeti impachetati (Packed byte): 8 octeti, 64 biti

Cuvinte impachetate (Packed word): 4 cuvinte, 64 biti

Dublu-cuvinte impachetate (Packed dword): 2 dcuvinte, 64 biti

Cuadruplu-cuvant (Quadword): 1 qcuvant, 64 biti

Sintaxa instructiunilor MMX

- $\langle \text{instructiune} \rangle := \langle \text{mnemonica} \rangle \quad [\langle \text{destinatie} \rangle, \langle \text{sursa} \rangle]$
- $\langle \text{mnemonica} \rangle := P \langle \text{operatie} \rangle \langle \text{sufixe} \rangle$
- $\langle \text{sufixe} \rangle := [\text{US} | \text{S} | \text{SS}] [\text{B} | \text{W} | \text{D} | \text{Q}] [\text{B} | \text{W} | \text{D} | \text{Q}]$
- Sufixele indica tipul datelor si modul de efectuare a a operatiilor aritmetice:
 - US – unsigned, saturation
 - S, SS – signed, saturation (in lipsa – wraparound)
 - B, W, D, sau Q – byte, word, dword, qword; daca apar 2 litere atunci sursa este de tipul primei litere iar destinatia de tipul celei de a doua litere
- Exemplu:

```
paddusw MM4, mem1  
psubusb MM4, mem1
```

Operatii aritmetice cu Saturare si cu Intoarcere (wraparound)

- Tehnici de solutionare a depasirilor de capacitate (superioara sau inferioara):
 - Prin “intoarcere”
 - Prin saturare

Exemplul 1: operatii cu numere fara semn (octeti):

Intoarcere:

$$F0h + 20h = 10h$$

$$80h - A0h = 20h$$

Saturare:

$$F0h + 20h = FFh$$

$$80h - A0h = 00h$$

Exemplul 2: operatii cu numere cu semn (octeti):

$$127 + 1 = -127$$

$$-128 - 1 = 127$$

$$127 + 1 = 127$$

$$-128 - 1 = -128$$

Operatii aritmetice cu saturare

- Exemplul 3: paddsw
7f38+1707 = 7fff - saturare

- Exemplul 4: paddusw
7f38+1707 = 963f - nu este saturare

+

Cu semn

Fara semn

Instructioni MMX

- EMMS
- Adunare si scadere
- Instructiuni de deplasare (shift)
- Instructiuni logice
- Instructiuni de multiplicare
- Instructiuni de comparare
- Instructiuni de impachetare/despachetare
- Instructiuni de transfer

Instructiuni MMX

- Instructiunea EMMS
 - Se foloseste dupa o secventa de instructiuni MMX si inainte de o instructiune in virgula flotanta pentru a evita generarea unei exceptii sau a unui rezultat incorect pt. operatii in virgula flotanta
 - Problema:
 - starea modulului MMX este o copie a starii unitatii flotante
 - dupa instructiuni MMX registrul tag al coprocesorului este alterat; poate genera o exceptie de tip stiva invalida
 - EMMS sterge starea MMX si astfel valideaza registrul tag (toate intrarile in stiva flotanta sunt validate)

Instructioni de adunare si scadere

| Instructione | b | w | d | q |
|--------------|---|---|---|---|
| padd | X | X | X | |
| padds | X | X | | |
| paddus | X | X | | |
| psub | X | X | X | |
| psubs | X | X | | |
| psubus | X | X | | |

paddxx <destinatie>, <sursa>

<destinatie>:= MMi

<sursa>:=MMi | <variabila>

Adunare si scadere - exemple

paddb MM3,MM4

| | | | | | | | | |
|----|----|----|----|----|----|----|----|-----|
| 80 | 7F | 01 | 01 | 80 | FF | 7F | 80 | MM3 |
| + | + | + | + | + | + | + | + | |
| FF | 17 | 38 | FF | 80 | FF | 7F | 7F | MM4 |

| | | | | | | | | |
|----|----|----|----|----|----|----|----|-----|
| 7F | 96 | 39 | 00 | 00 | FE | FE | FF | MM3 |
|----|----|----|----|----|----|----|----|-----|

paddd MM2, MM1

| | | | | | | | | |
|----|----|----|----|----|----|----|----|-----|
| 80 | 7F | 01 | 01 | 80 | FF | 7F | 80 | MM2 |
|----|----|----|----|----|----|----|----|-----|

| | | | | | | | | |
|----|----|----|----|----|----|----|----|-----|
| FF | 17 | 38 | FF | 80 | FF | 7F | 7F | MM1 |
|----|----|----|----|----|----|----|----|-----|

| | | | | | | | | |
|----|----|----|----|----|----|----|----|-----|
| 7F | 96 | 3A | 00 | 01 | FE | FE | FF | MM2 |
|----|----|----|----|----|----|----|----|-----|

Instructiuni de deplasare (shift)

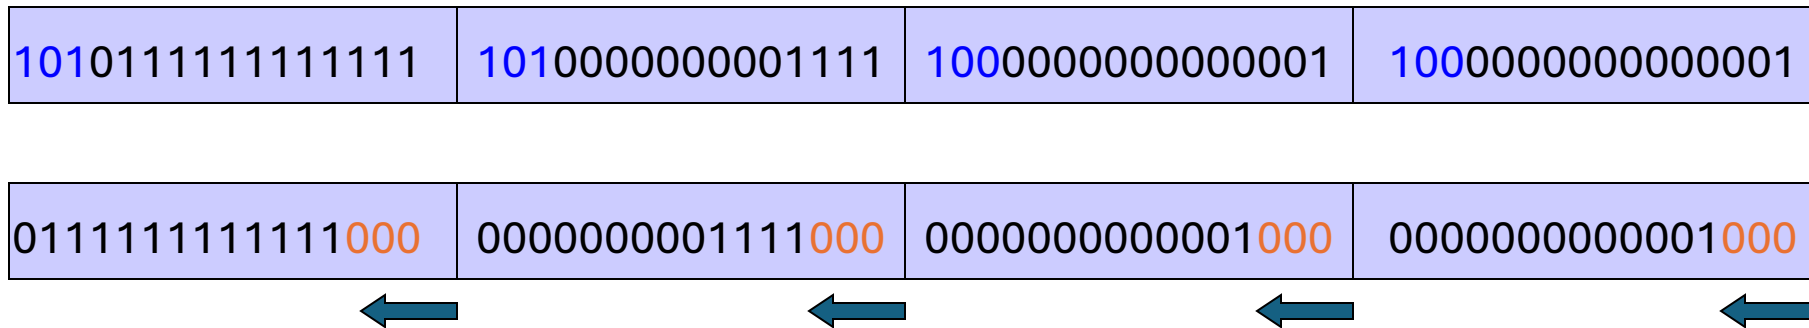

| Instructiune | b | w | d | q | |
|--------------|---|---|---|---|------------------------|
| psll | | X | X | X | Shift left logic |
| psra | | X | X | | Shift right arithmetic |
| psrl | | X | X | X | Shift right logic |

psllx | psrax | psrl <destinatie>, <numar>

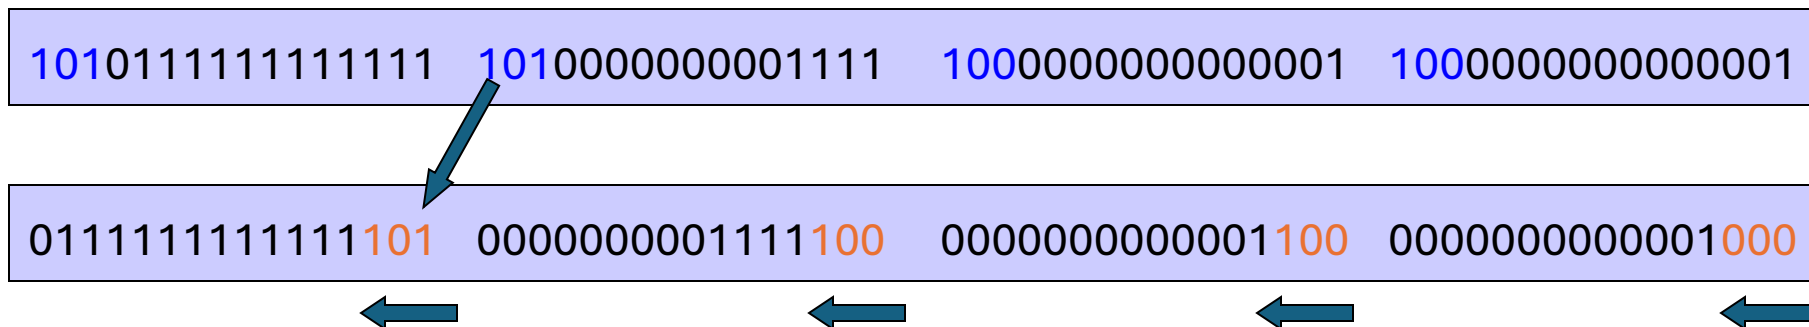

Elementele destinatiei se deplaseaza la stanga sau la dreapta cu un <numar> de pozitii binare

Instructioni de deplasare - exemple

psllw MM4, 3

psllq MM4, 3

Instructiuni logice

| Instructiune | 64 biti |
|--------------|---------|
| pand | X |
| pandn | X |
| por | X |
| pxor | X |

$X = X \text{ AND } Y$

$X = (\text{NOT } X) \text{ AND } Y$

$X = X \text{ OR } Y$

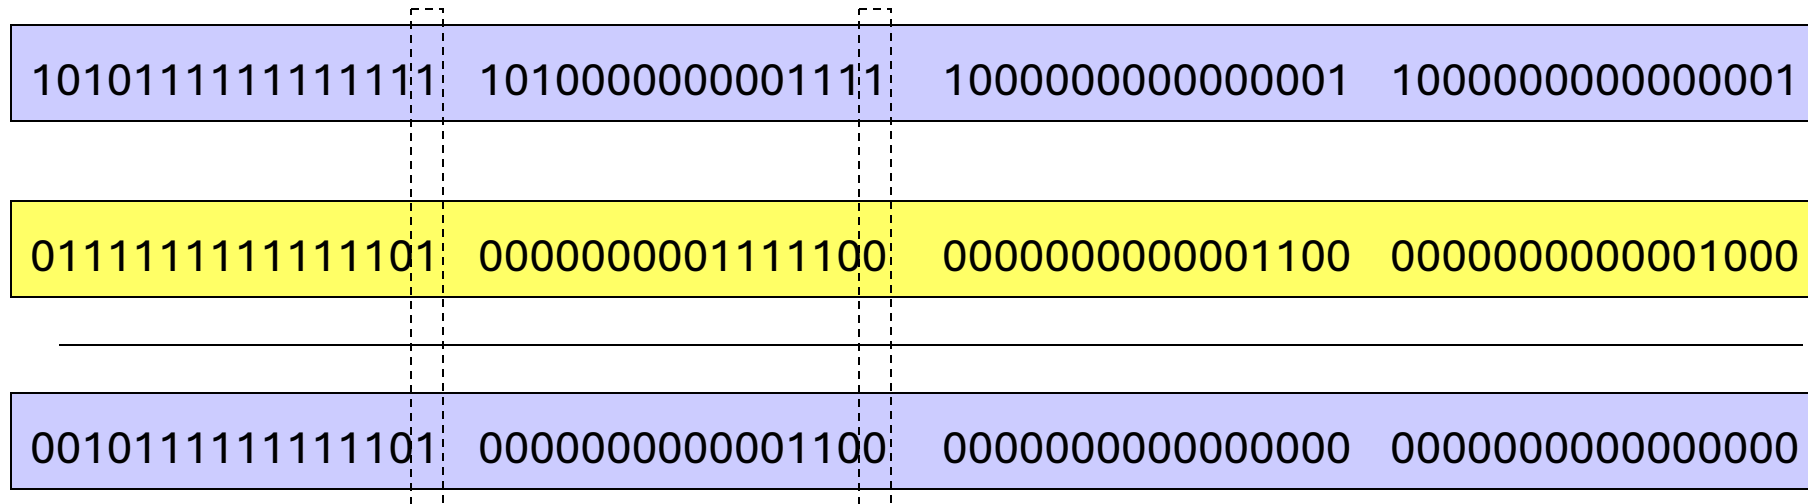

$X = X \text{ XOR } Y$

pand | pandn | por | pxor <destinatie>, <sursa>

Operatia logica se executa bit cu bit

Instructioni logice - exemplu

pand MM4, MM3

Instructioni de multiplicare

| Instructioni | b | w | d | q |
|--------------|---|---|---|---|
| pmadd | | → | | |
| pmulh | | X | | |
| pmull | | X | | |

multiply and add

multiply and keep high

multiply and keep low

pmadd – multiply and add

$$X_{31-0} = X_{15-0} * Y_{15-0} + X_{31-16} * Y_{31-16}$$

$$X_{63-32} = X_{47-32} * Y_{47-32} + X_{63-48} * Y_{63-48}$$

Instructioni de multiplicare

pmadd MM3,MM4

Instructioni de multiplicare

pmulh MM3,MM4

| | | | | |
|---------|---------|---------|---------|-----|
| 7 1 C 7 | 8 D 9 4 | 8 0 0 0 | 7 1 C 7 | MM3 |
|---------|---------|---------|---------|-----|

| | | | | |
|---------|---------|---------|---------|-----|
| 8 0 0 0 | C F C B | F F F F | 0 4 0 0 | MM4 |
|---------|---------|---------|---------|-----|

C71C8000 158BF05C 00008000 01C71C00

| | | | | |
|---------|---------|---------|---------|-----|
| C 7 1 C | 1 5 8 B | 0 0 0 0 | 0 1 C 7 | MM3 |
|---------|---------|---------|---------|-----|

pmull MM3,MM4

| | | | | |
|---------|---------|---------|---------|-----|
| 8 0 0 0 | F 0 5 C | 8 0 0 0 | 1 C 0 0 | MM3 |
|---------|---------|---------|---------|-----|

Instructioni de comparare

| Instructioni | b | w | d | q |
|--------------|---|---|---|---|
| pcmpeq | X | X | X | |
| pcmpgt | X | X | X | |

compare equal

compare greater (intregi
cu semn)

Exemplu: pcmpeqw MM3,MM4

| | | | | |
|---------|---------|---------|---------|-----|
| 0 0 0 0 | 1 2 3 4 | F F F F | 0 0 C B | MM3 |
|---------|---------|---------|---------|-----|

| | | | | |
|---------|---------|---------|---------|-----|
| 0 5 6 0 | 1 2 3 4 | 1 3 F F | 0 0 C B | MM4 |
|---------|---------|---------|---------|-----|

| | | | | |
|---------|---------|---------|---------|-----|
| 0 0 0 0 | F F F F | 0 0 0 0 | F F F F | MM3 |
|---------|---------|---------|---------|-----|

Instructiuni de impachetare/despachetare

| Instructiuni | b | w | d | q | |
|--------------|---|---|---|---|-------------------------|
| packss | ← | ← | | | pack signed, saturation |
| packus | ← | | | | pack signed to unsigned |
| punpckh | → | → | → | → | unpack high |
| punpckl | → | → | → | → | unpack low |

Impachetare: copierea unei structuri mai mari (ex: word) intr-o structura mai mica (ex: byte) cu saturare in caz de nevoie

Despachetare: interclasarea elementelor celor doi operanzi – se foloseste pentru extinderea reprezentarii

Instructioni de impachetare/despachetare

Exemplu de impachetare

packss MM3,MM4

ns – nesaturat

$7F39 = 32569 > 7F00 = 32512 \Rightarrow \text{sat.}$

s - saturat

$FFC9 = -37 > 8000 = -32512 \Rightarrow \text{nsat.}$

$1111.1111.1100.1001 \Rightarrow 1100.1001$

Instructioni de impachetare/despachetare

Exemplu de despachetare

punpckhwd MM3,MM4 ; cuvant ->dublu-cuvant

Instructiuni de transfer

| Instructiune | 32biti | 64 biti |
|--------------|--------|---------|
| movd | X | |
| movq | | X |

move dword (32 biti)

move qwordword (64 biti)

movd | movq <destinatie>, <sursa>

<destinatie> := MMi | <variabila_mem> | <registru_x86>

<sursa> := MMi | <variabila_mem> | <registru_x86>

exemple: movd MM2, var_32 ; se extinde cu 0

 movd var_32, MM3 ; se copiaza partea low

 movq var_64, MM5

Exemple de proceduri MMX

Produsul scalar a doi vectori: $\sum a(i)*b(i)$

MM0

MM1

```
et:  movq  MM0, [adr_v_a]
      movq  MM1, [adr_v_b]
      pmaddwd MM0, MM1
      padd  MM2, MM0
      add   adr_v_a, 8
      add   adr_v_b, 8
      sub   contor
      jnz   et
      movq  MM0, MM2
      psrlq MM2, 32
      padd  MM2, MM0
      movd  rez, MM2
```

Exemple de programe MMX

Suprapunerea selectiva a imaginilor

1. pcmpeqb MM1, MM3
2. pand MM4, MM1
3. pandn MM1, MM3
4. por MM4, MM1
